Department of Planning and Environment

# Floodplain harvesting in the Namoi Valley

December 2022

# Acknowledgement of Country

## **Overview of Proceedings**

- Context setting
  - NSW Government priority
  - Namoi timeframes and influencing factors
- 2. Namoi technical assessments
  - Model build
  - Model scenarios
  - Cumulative downstream outcomes
  - Predicted environmental benefits
- 3. Namoi proposed water sharing rules for floodplain harvesting licences
  - How to make a submission

#### Introduction of Presenters

#### **Facilitator**

• Steve Rossiter, ATX Consulting

#### **Presenters**

- Mitchell Isaacs, Chief Knowledge Officer
- Dan Connor, Director Floodplain Management
- Michael Sugiyanto, Lead Modeller
- Allan Raine, Director Water Planning Implementation

Context setting – what are we doing and why are we doing it now?

Mitchell Isaacs, Chief Knowledge Officer

#### **NSW Government priority**

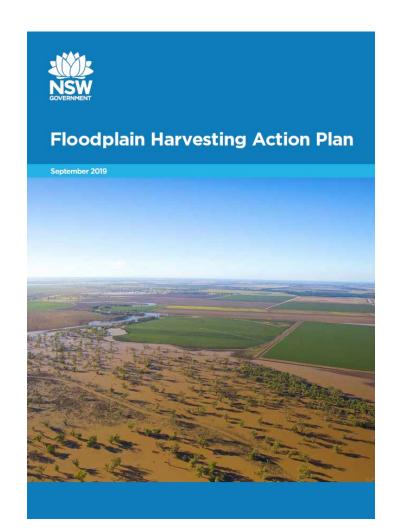

SELECT COMMITTEE ON FLOODPLAIN HARVESTING

- Healthy rivers and healthy farms not one or the other
- Doing nothing is not an option
- Reform will improve
  - environmental protections
  - environmental and downstream outcomes
  - · security and certainty for businesses and communities.

This reform is too important to delay

#### Namoi timelines and influencing factors

Note: WSP submission period intentionally overlaps peer review

- public submissions
- peer review outcomes
- draft entitlement submission outcomes
- concurrence to amend the WSP

# Floodplain harvesting in the Northern Basin

Dan Connor, Director Floodplain Management

#### Floodplain harvesting reform - outcomes for NSW

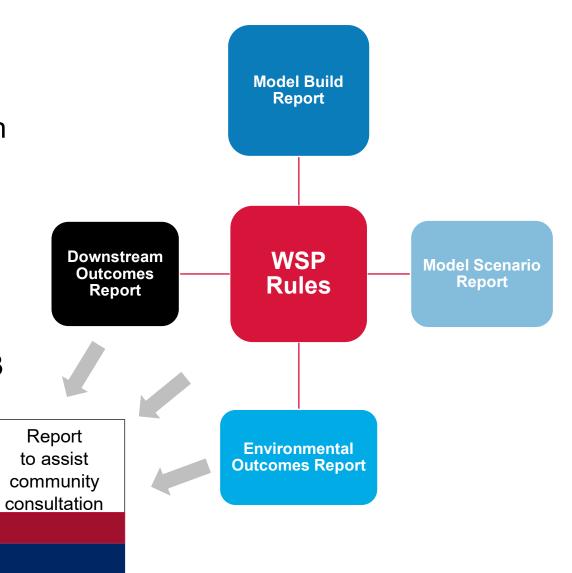

Implementation of the policy will esturn diversions to legal limits improve cultural outcome provide environmental benefit before/after implementation Thore water on floodige diversions diversions stablicansing framework through it to downstream communities \egislation information via telemetry

#### **Current status – Northern Basin**

| Valley         | WSP Consultation | Work Approvals | Licences   | WSP Rules  |
|----------------|------------------|----------------|------------|------------|
| Border Rivers  |                  |                |            |            |
| Gwydir         |                  |                |            |            |
| Macquarie      |                  |                | Q1-Q2 2023 |            |
| Barwon-Darling |                  | Q1 2022        | Q1-Q2 2023 | Q1-Q2 2023 |
| Namoi          | Q4 2022          | Q1-Q2 2023     | Q1-Q2 2023 | Q1-Q2 2023 |

# **Current stage- WSP Consultation - Namoi**

- Development of proposed rules
- Report to assist brings it all together
- WSP rules come into effect thru conditions on licences and approvals
- Webinar, 6 December
- Public meeting in Wee Waa, 13 December
- Submissions close 29 January 2023
- What we heard report February/March 2023

# **Questions and answers**

Steve Rossiter

# Floodplain harvesting – Namoi model

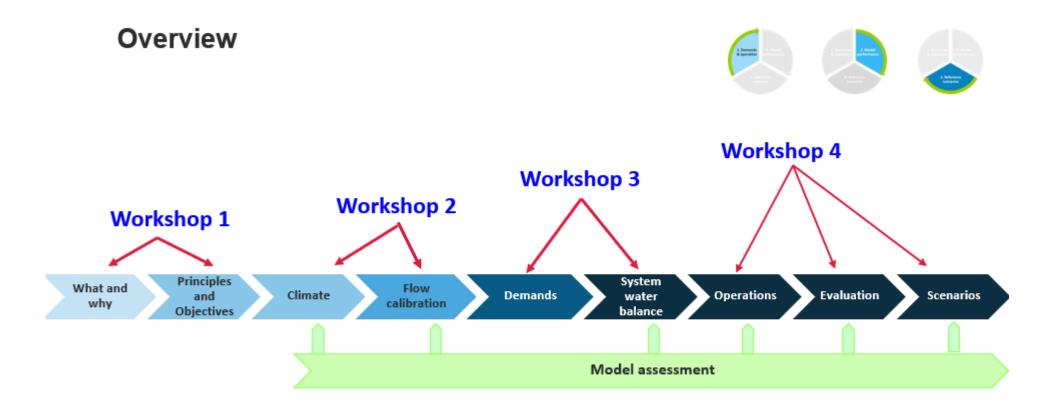

Michael Sugiyanto, Lead Modeller

#### Using models to determine licences

- Models used to inform water management, policy and planning
- Emerged modelling responsibility to determine floodplain harvesting entitlements
- Pre-existing models fit for *prior* purposes:
  - Policy, planning, diversion compliance
- BUT has critical limitations for estimating floodplain harvesting
- Upgraded modelling includes unprecedented additional detail
  - New data (e.g. individual farm visit)
  - Additional capability (floodplain harvesting)
  - NHMP Commitment → IQQM to eWater Source

#### Model implementation process

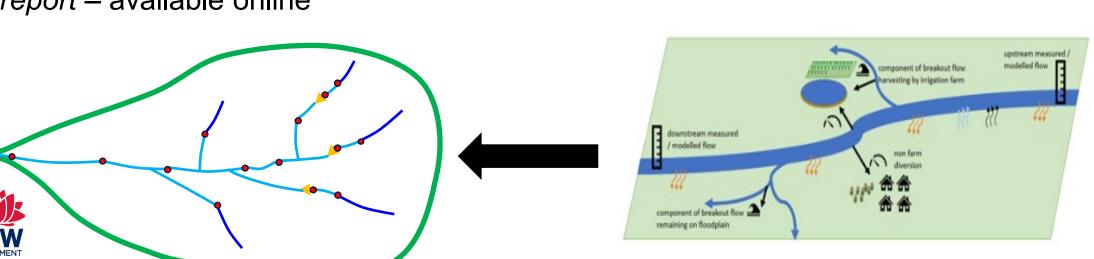

## **Building the model of the Namoi**

#### **Technical report**

 How modelling of floodplain harvesting was undertaken for the Namoi Valley

Independent review

 Building the Namoi Valley river system model report – available online

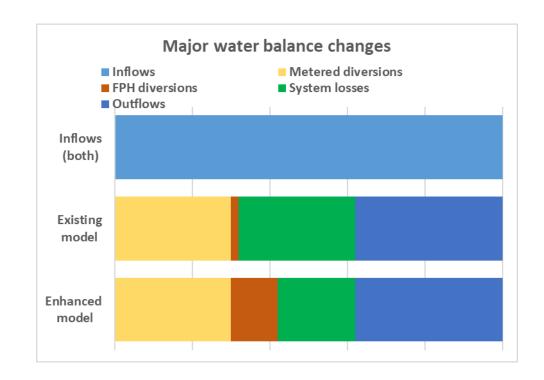

Non irrigated developed area

Permanent on farm storag

# Water balance outcomes at valley scale

- Inflows don't change
- Metered diversions don't change
- Flow remaining in rivers does not change
- Previous high system 'losses' repartitioned:
  - Lower losses
  - Floodplain harvesting
- Return flows not modelled

# Fully simulated performance

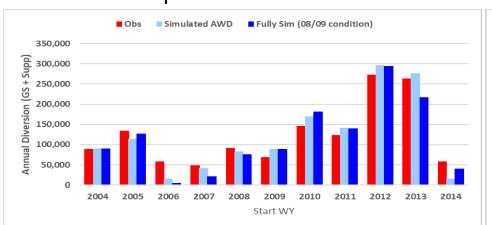

All components simulated

| Run description | Forcing |     |               |
|-----------------|---------|-----|---------------|
|                 | Area    | AWD | Keepit inflow |
| AWD             |         |     |               |

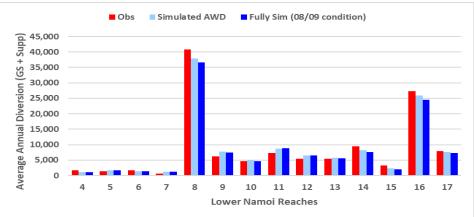

- Shows progressive degradation as more things are simulated
- Reproduces average behaviour rather than unique decisions

| Run               | GS  | SA  | GS +<br>SA |
|-------------------|-----|-----|------------|
| Irrigation demand | -4% | -6% | -4%        |
| Area Risk         | -2% | 9%  | -1%        |
| Simulated AWD     | 1%  | -9% | -2%        |
| Full simulating   | -4% | -9% | -5%        |

#### **Temporal Performance**

#### **Spatial Performance**

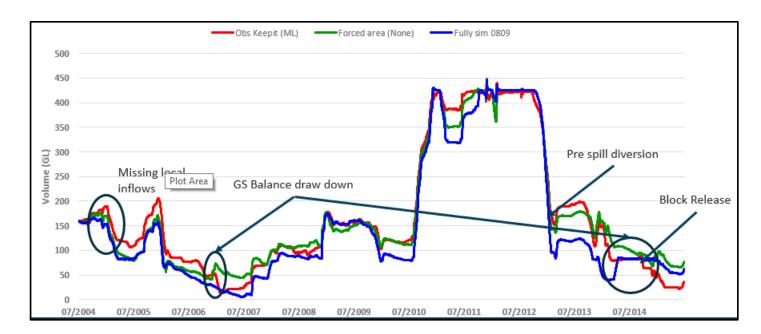

#### Model performance

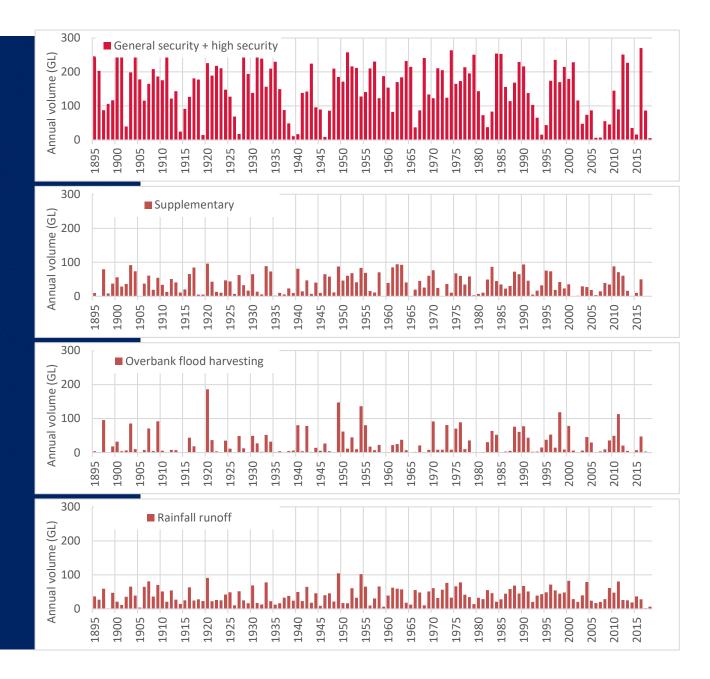

#### Keepit storage volume

- Biggest degradation when simulating crop area (average risk function)
- 2011/12 event came around Nov/Dec model is configured with planting decision around mid October

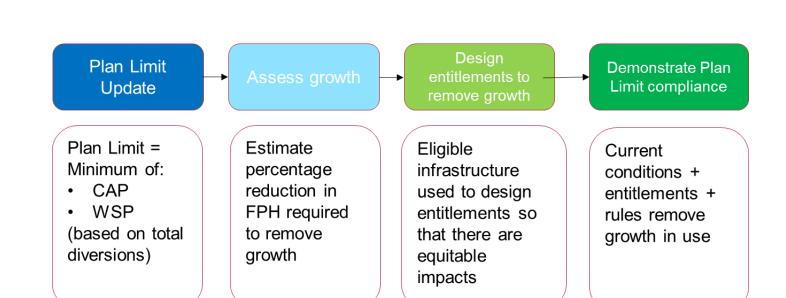

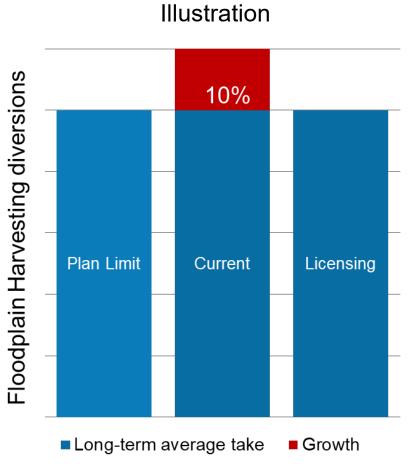

# Namoi water balance

#### Scenarios and their usage to determine entitlements

#### **Model Scenario – Namoi**

#### **Technical report**

- Model run of the Namoi used to determine entitlements
- Floodplain Harvesting Entitlements for Namoi Regulated River System Model
   Scenario Report available online

| Dates of development | Developed area (ha) | Permanent on-farm storage capacity (ML) |
|----------------------|---------------------|---|
| 1993/1994            | 68,170              | 139,580                                 |
| 1999/2000            | 69,480              | 173,180                                 |
| 2008/2009            | 93,450              | 208,820                                 |
| Current              | 97,260              | 218,240                                 |

43% increase in developed area since 1993/94 57% increase in permanent storage since 1993/94

#### **Model Scenario – Namoi**

| Diversion category                        | Plan Limit<br>Scenario (GL/yr) | Current Conditions<br>Scenario (GL/yr) |  |
|---|--------------------------------|--|--|
| General and High Security                 | 144.6                          | 144.8                                  |  |
| Supplementary Access                      | 34.4                           | 42.1                                   |  |
| Floodplain harvesting (A + B)             | 46.5                           | 51.3                                   |  |
| (A) Overbank flow harvesting              | 25.2                           | 30.6                                   |  |
| (B) Non-exempt rainfall runoff harvesting | 21.3                           | 20.7                                   |  |
| (C) Exempt rainfall runoff harvesting     | 16.2                           | 21.0                                   |  |
| TOTAL (less exempt rainfall)              | 225.6                          | 238.3                                  |  |
| TOTAL                                     | 241.7                          | 259.3                                  |  |

#### 5.6% growth above the legal limit

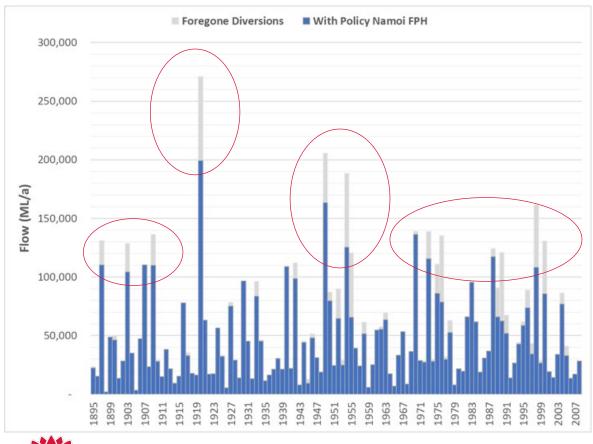

10% growth in floodplain harvesting (addressed via licensing)

22% growth in Supplementary Access (addressed via AWD process)

Result = 13 GL/yr returned to floodplains, rivers & creeks

#### Annual changes to floodplain diversions

- Long-term averages can 'mask' the annual changes
- Biggest impacts are in the wet years
- All valleys included in the cumulative downstream outcome report

#### Modelling review and governance processes

STEP 1 Identification of eligible works

River system models use eligible works information to design individual FPH shares

Internal and external reviews of models

STEP 2
Farm scale validation

Results of the models have been tested through a submissions process

Review committee considers submissions

STEP 3
Draft WSP
rules + tech
reports

Models have been used to update Plan Limit estimates and test impacts of the proposed FPH rules MDBA to review as part of WRP accreditation

Draft entitlements

# Floodplain harvesting – downstream assessments

Michael Sugiyanto, Lead Modeller

#### Modelled downstream effects - Northern Basin

#### All valleys licensed 100% return flows = maximum possible flow increase

| Location              | Annual<br>mean flow<br>(GL) | Annual mean<br>flow change<br>(GL) | Annual mean<br>flow change<br>(%) | Annual<br>max flow<br>change<br>(GL) | Change in<br>max year<br>(%) |
|-----------------------|-----------------------------|------------------------------------|-----------------------------------|--------------------------------------|------------------------------|
| Walgett (422001)      | 1,306.9                     | +37.5                              | +2.9                              | +328.0                               | +8.2%                        |
| Bourke (425003)       | 1,837.7                     | +31.1                              | +1.7                              | +289.9                               | +4.0%                        |
| Wilcannia<br>(425008) | 1,376.8                     | +22.0                              | +1.6                              | +166.8                               | +14.1%                       |

#### Annual flow increases

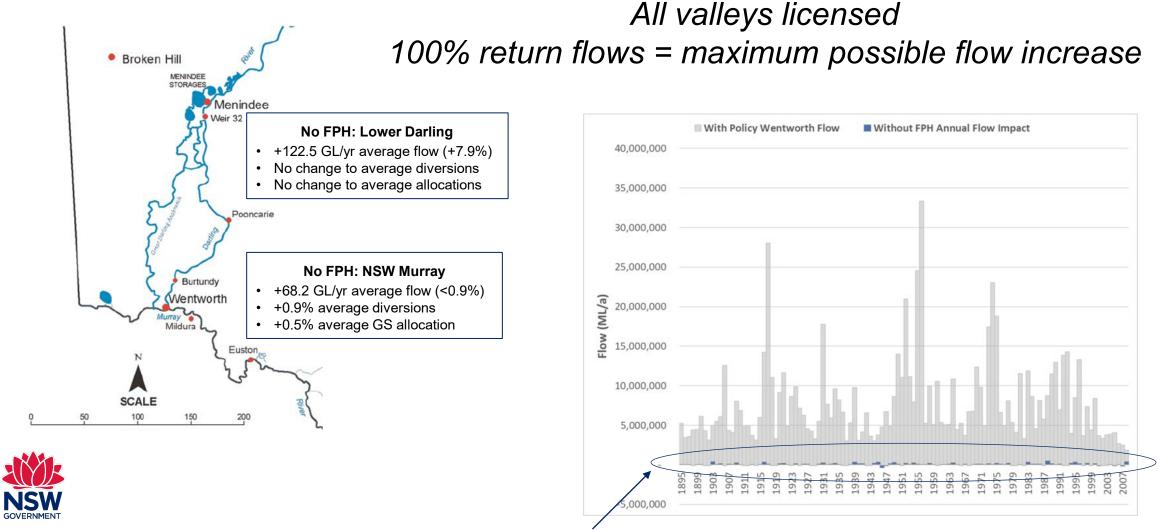

Walgett: 0 - 328GL/yr

*Bourke:* 0 - 290GL/yr

Wilcannia: 0 -167GL/yr

#### Modelled downstream effects – Southern Basin

## **Benefits snapshot**

#### Impacts and benefits are correlated

 Within individual floodplains (valleys) – significant benefits to many interests

Valley-based analyses at:

https://www.industry.nsw.gov.au/water/plansprograms/healthy-floodplains-project/water-sharingplan-rules

- Within northern Basin modest benefits to many interests during wet and very wet periods
- Within southern Basin no disbenefits to water allocations or flows from floodplain harvesting in the northern Basin

#### **Questions and Answers**

Steve Rossiter

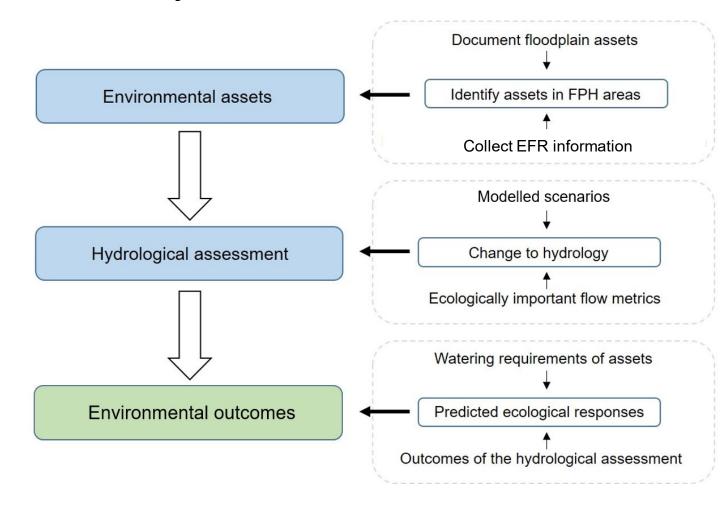

# Predicted environmental outcomes

Dan Connor, Director Floodplain Management

## How did we identify the environmental outcomes?

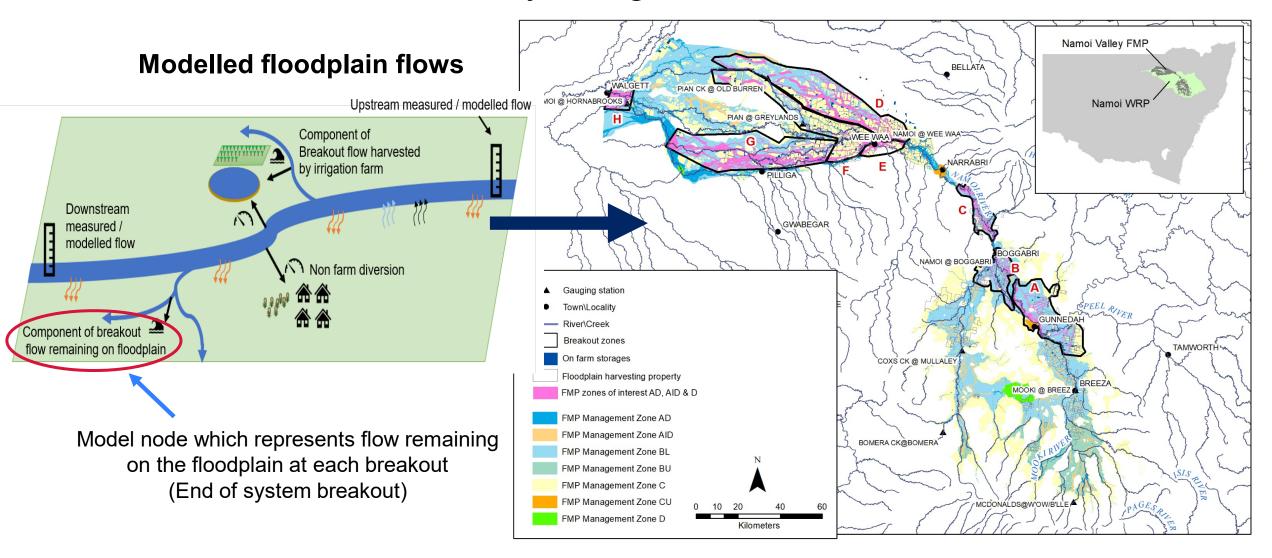

#### Assessment is driven by data availability

- 1. Floodplain environmental assets (locations) and values (species or functions)
- 2. Hydrological models: with and without the policy
- 3. Environmental flow requirements for these assets and values

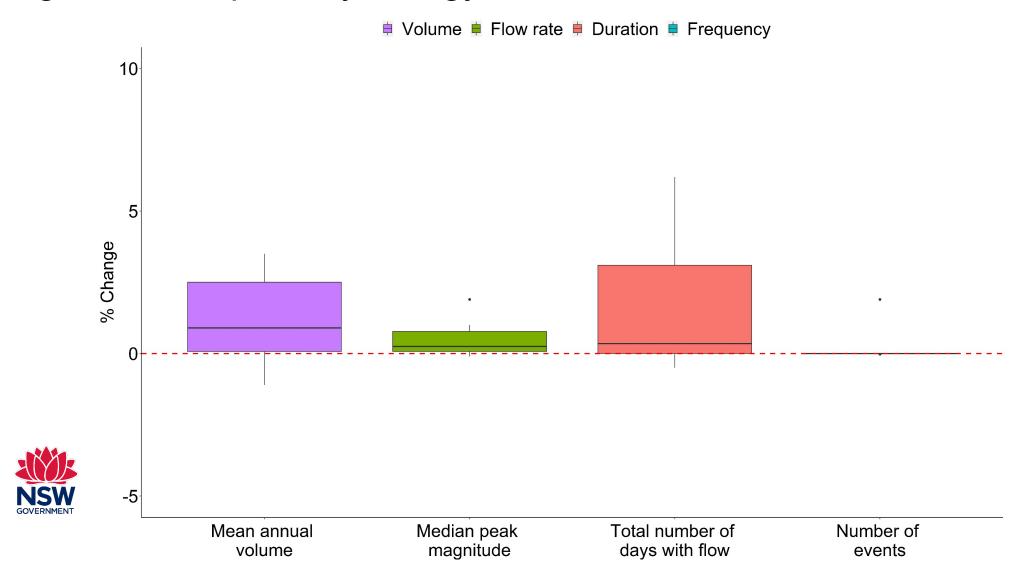

#### Selecting locations for the assessment

Breakout zones are where hydrologic information is available

#### What are the predicted outcomes for the Namoi?

#### Changes to floodplain hydrology

#### Changes to floodplain hydrology cont.

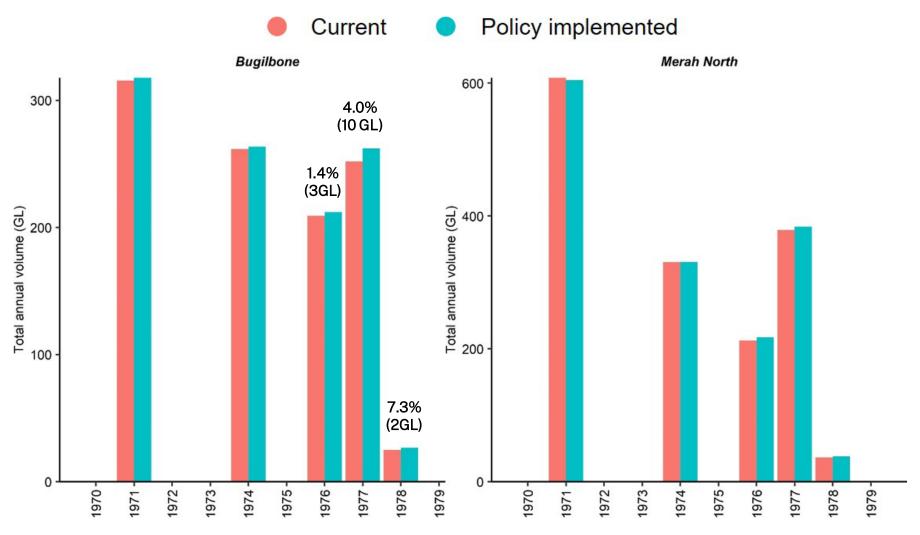

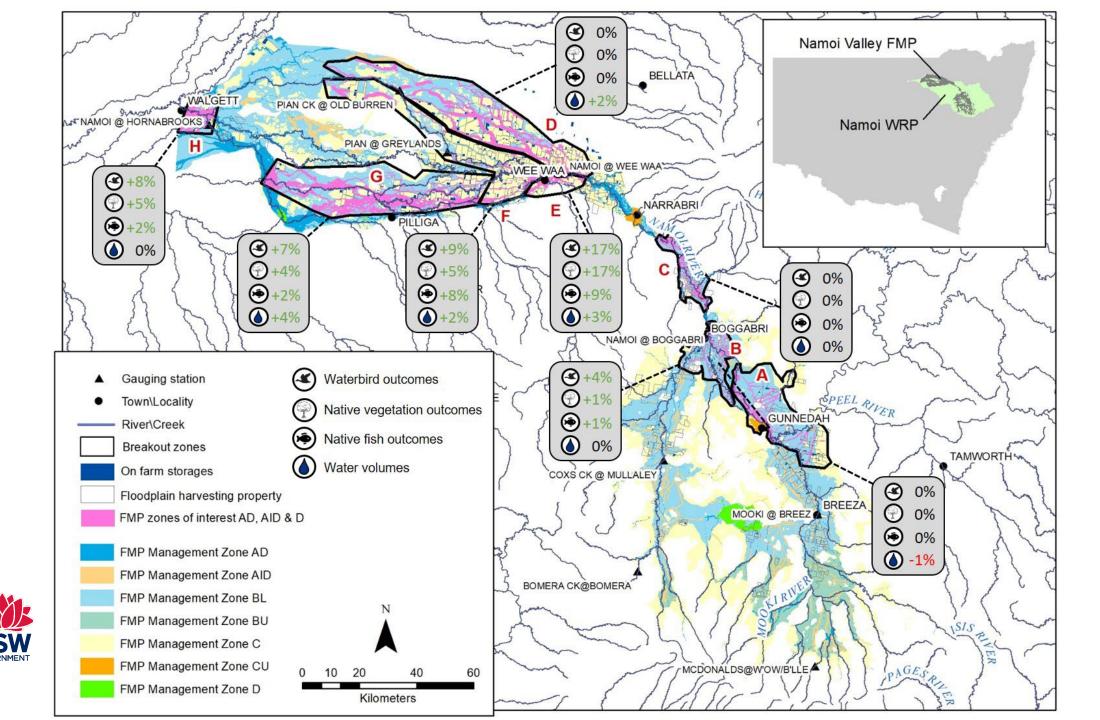

Figure 16. Modelled total annual volumes (GL/year) 1970-1979 and floodplain breakout volume (GL/d) for two the breakout zones with most predicted change to hydrology (Bugilbone (G) and Merah North (F)). Data represents the volumes remaining after FPH diversions have been applied.

#### Predicted ecological outcomes: Native fish

- Representatives of three fish guilds: flow pulse, floodplain specialists, and generalists
- In total, 10 EFR metrics and 23 tests were undertaken
- 10 are predicted to improve by 5-10%
- Another 10 are not predicted to change by more than 1%

Outcomes varied considerably by location, with only 3 from 8 zones improving by more than 2% (7-9% increase averaged across native fish)

### Predicted ecological outcomes: Native vegetation

- Key species assessed:
  - Lignum, blackbox, coolabah, river cooba, river red gum and water couch
- Small increase in the achievement of most the native vegetation EFRs tested
- Predicted changes varied greatly across the floodplain:
  - 3 zones expected to receive improvements of more than 5% with little change to others

#### **Questions and Answers**

Steve Rossiter

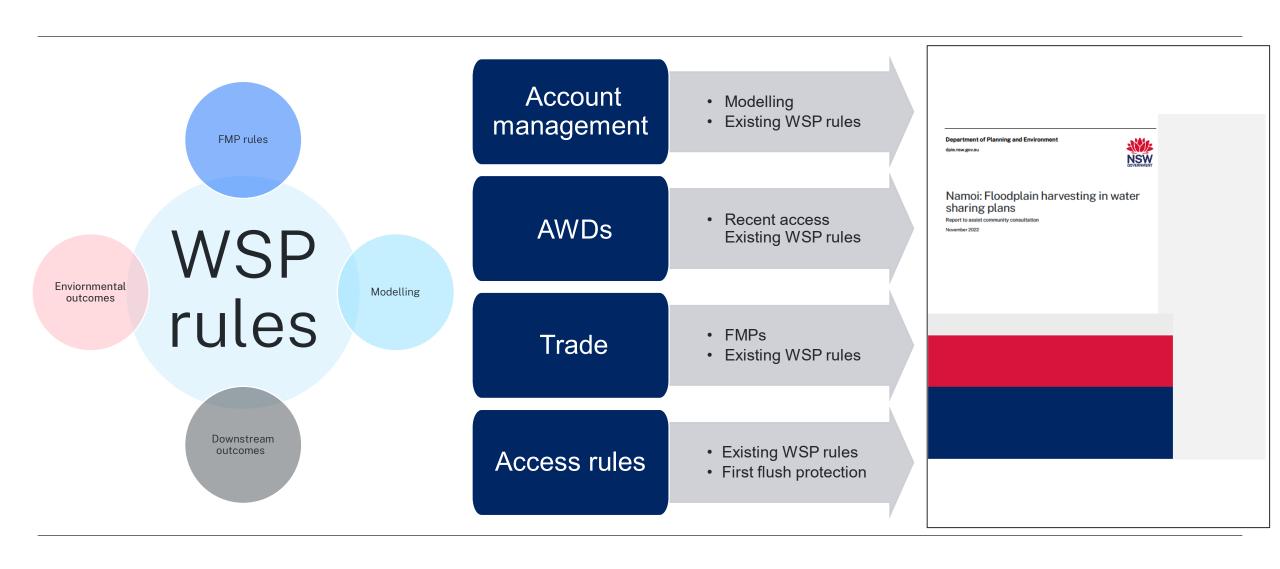

# Floodplain harvesting rules – Namoi

Dan Connor, Director Floodplain Management

#### Report to assist community consultation – the rules

# Water sources and floodplains

| Floodplain harvesting (regulated river)     | Floodplain harvesting (unregulated river) |
|---|---|
| Lower Namoi Regulated River<br>Water Source | Namoi Unregulated River Water Sources     |
| Lower Namoi Valley Floodplain               | Lower Namoi Valley Floodplain             |
| Upper Namoi Valley Floodplain               | Upper Namoi Valley Floodplain             |
| Gwydir Valley Floodplain                    |   |

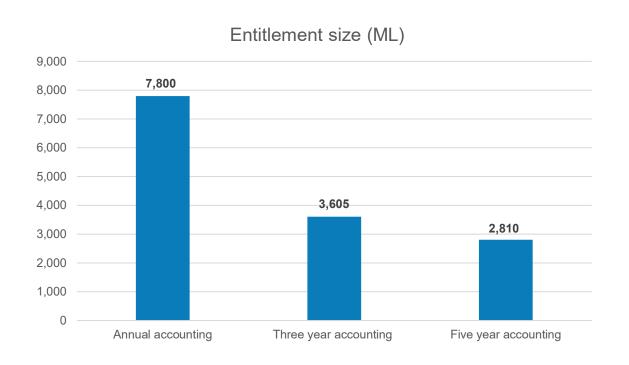

# Floodplain harvesting rules – Namoi regulated

Dan Connor, Director Floodplain Management

### Account management rules

#### Annual vs 3-year vs 5-year

Short accounting = large entitlements

Large entitlements = growth potential

Large entitlements = impacts in wet years only

#### **Allocations**

Account initialisation of 1 ML per unit share

Maximum of 1 ML per unit share each year

#### **Trade rules**

#### Basin Plan 2012

"Free trade of surface water is required except where establishing a restriction is required due to a physical constraint, lack of connectivity, or the environment may be harmed."

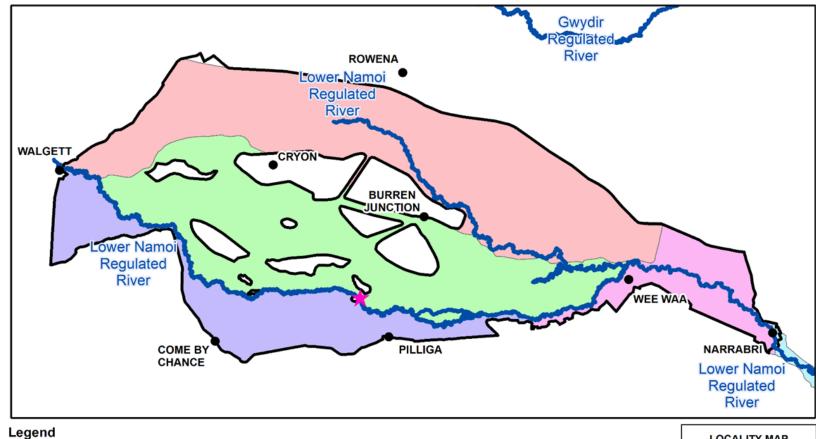

In establishing trade rules the department is intending to:

- 1. prevent concentration of entitlement that may impact sensitive environmental areas, and
- 2. protect areas important for flood flow connectivity or that contain identified environmental or cultural assets

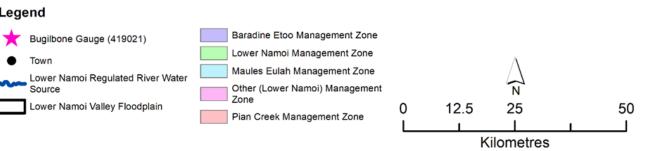

### Trade rules – preventing concentration

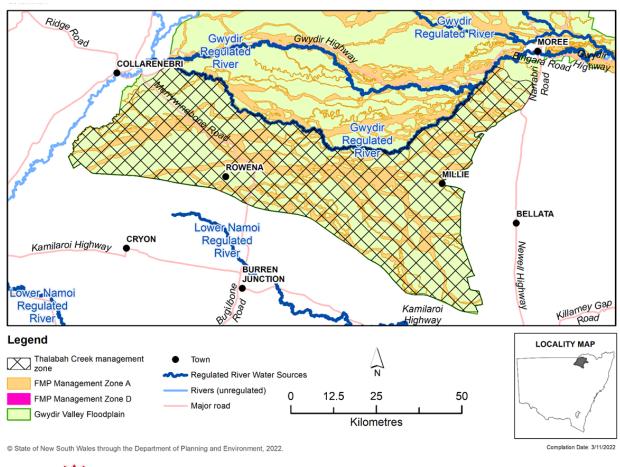

- Based on existing water source boundaries
- Grouped to provide meaningful trade opportunities

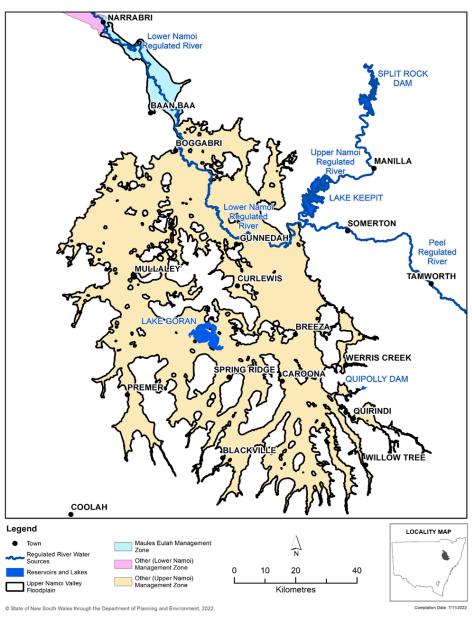

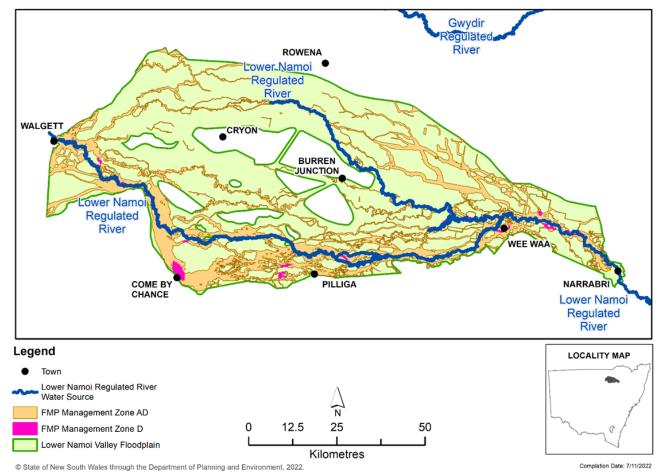

#### Trade rules – preventing concentration

## Rules – protecting identified areas

 Based on floodplain management plan zones

 No new works or increased capacity to take from the zone

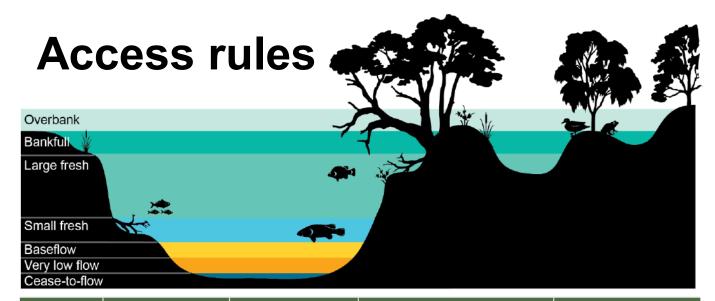

## Rules – protecting identified areas

|                            | Gauging site and number                     | Low flows        |          | Freshes  |             |                         | Bankfull and overbank |                   |
|----------------------------|---|------------------|----------|----------|-------------|-------------------------|-----------------------|-------------------|

Source: Namoi LTEWP

- Objective
  - assist in protecting 'first flush flows'
  - reduce future reliance on s.324 restrictions
- Rule: restrict take when:
  - Menindee Lakes is below 195 GL,
  - and there is less than 4,500
     ML/day of flow @ Bugilbone gauge
- Amendment provisions require a review prior to 30 June 2025

# FPH Rules – Namoi Unregulated River

Dan Connor, Director Floodplain Management

### Floodplain harvesting: unregulated rivers

# Volumetric Conversion - the next stage

A booklet for landholders with licences on unregulated rivers in NSW

- Completes volumetric conversion process for unregulated river water sources
- Restores equity in volumetric conversions across all forms of surface water access
- All conversions based on maximum irrigated areas:
   1993-99
- Key difference:
  - Unregulated river conversions based on landholder survey
  - Floodplain conversions based on remote sensing analysis

#### Account management rules

Same licence process as unregulated river = same accounting rules

- Take limit: 3ML/unit share over 3 consecutive years
- Account limit: 3ML/unit share at any time

#### **Allocations**

Account initialisation of 1 ML per unit share

Maximum of 1 ML per unit share each year

#### **Trade Rules**

- Reflect those currently applied to unregulated river licences, plus
- Reflect those proposed for floodplain harvesting (regulated)
  - within designated floodplain
  - no new works in management zones AD and D
- Supported by rules for granting or amending of approvals

#### Submit your online feedback

#### Water sharing plan rules for floodplain harvesting at:

www.industry.nsw.gov.au/water/plans-programs/healthy-floodplains-project/water-sharing-plan-rules

Submissions will be accepted until 11.59 pm, Sunday 29 January 2023.

Late submissions will not be accepted.

#### **Questions and Answers**

Steve Rossiter

# Namoi – LTAAEL compliance

Allan Raine, Director Water Planning Implementation

#### What's LTAAEL?

#### Long-term average annual extraction limit

- Described in the Namoi regulated Water Sharing Plan

#### 29 Volume of the long-term extraction limit

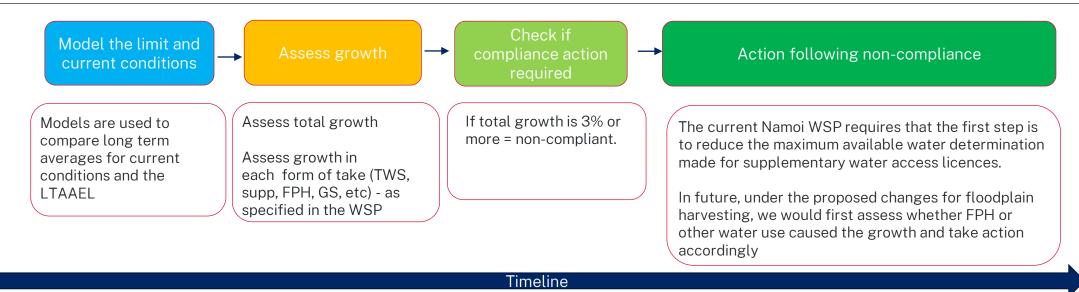

- (1) This Plan establishes a long-term extraction limit for these water sources being the lesser of:
  - (a) the long-term average annual extraction from these water sources that would occur with the water storages and water use development that existed in 1999/2000, the share components in this water source that existed on 1 July 2004 and the water management rules that were defined in this Plan on 1 July 2004, or
  - (b) the long-term average annual extraction from these water sources that would occur under Cap baseline conditions.

Not related to compliance for individual licence holders

|   | Question   | Answer  |
|---|--|---|
| • | If we only use what is allocated in our accounts, how can we have exceeded limits? | In the NSW MDB, SDLs and LTAAELs are based on historic levels of development. This means these limits can be exceeded even if all individuals are only taking what has been allocated to them. If the limits are exceeded, we may need to change allocations or take other actions as described in our water sharing plans. |

## Next steps

February 2023: external review of SOURCE model completed

March 2023: If no substantial issues from the review, SOURCE will become the best available information for LTAAEL compliance

We plan to provide you an update in **April 2023** 

1 July 2023: Supplementary access AWD will be less than 100% if compliance action is required

## **FAQs**

| Question   | Answer  |
|--|---|
| Under the Murray Darling Basin Cap, there were large credits. Doesn't this mean that we use less than allowed? | Compliance with LTAAEL and SDL is still required. We expect that there would be credits under the Cap because our water sharing plans set out new rules for sharing, including more water for the environment. These rules form part of the new limits; the LTAAEL and the SDL. |

| Question  | Fact  |
|---|---|
| We haven't extracted<br>much water this year so<br>how is it possible to<br>have exceeded limits? | We often refer to the SDL and LTAAEL as a long term average number. But, when we assess compliance we aren't comparing a single year to that average. Both methods take into account expected variations in water use.  SDL compliance uses a model to estimate permitted take and is a cumulative assessment from 2019 (or WRP accreditation date). LTAAEL compliance is assessed using long term model comparisons. |

# Why aren't SDL and LTAAEL compliance outcomes always the same?

- different periods of time and triggers (SDL starting in 2019.)
- reported at different spatial scales (SDL combines reg and unreg)
- include different types of water use (SDL includes all water use except HEW)

# Illustration of growth in use action through Supplementary AWD reduction

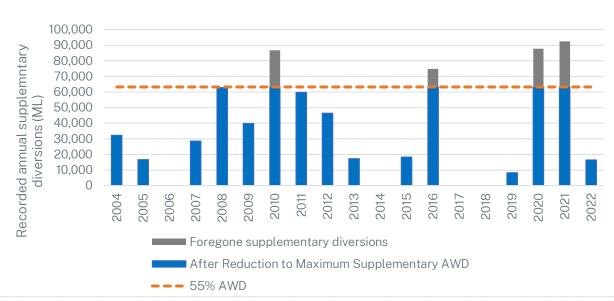

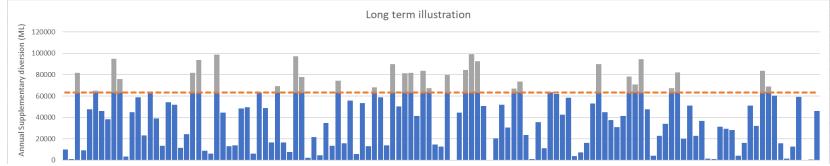

Historically Supplementary receives 100% AWD at the start of water year for the Namoi.

Reduction is only effective when surplus water is more than AWD. In most years the AWD has no impact.

In the example, 45% reduction (55% AWD) only has an effect in 4 out of 19 years.

High variability over the years means large AWD reduction is required to remove growth and bring it back to the limit.

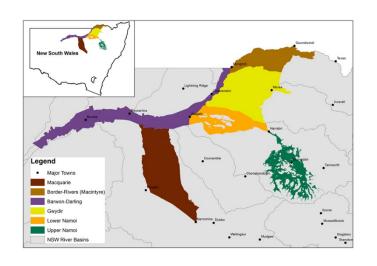

# FPH measurement requirements

Allan Raine, Director Water Planning Implementation

# 2. Where will the floodplain harvesting measurement apply?

| Valley         | Storages |  |
|----------------|----------|--|
| Gwydir Valley  | 324      |  |
| Border Rivers  | 110      |  |
| Macquarie      | 178      |  |
| Barwon Darling | 86       |  |
| Namoi          | 447      |  |

Approx. 1,145 storages across northern valleys

Landholders have 12 months to install 'primary metering equipment'.

Landholder can use 'secondary metering equipment', such as a gauge board, if they wish to floodplain harvest during that time.

#### All metering All equipment equipment must be validated by needs tamper a duly qualified evident seals. person (DQP). A local intelligence device securely records and Water users and government transmits data via telemetry. agencies have near real-time access to water take data. Water stored from a floodplain harvesting event is calculated based on comparing the × -+ = volume of water in the storage to the volume of water after the event. A storage meter Backup measures the water measurement depth. These are specific

meters for floodplain

harvesting measurement.

The future of accurate, auditable and tamper proof measurement explained

device in case the

primary meter fails.

A survey benchmark ensures meters are calibrated.

3. Measurement

in practice

#### 4. Measurement methods

Floodplain harvesting occurs when water is either collected and impounded in an on-farm storage or is directly used.

There are 2 ways you can measure floodplain take:

- at the storage method OR
- point-of-intake method.

## 5. Measurement period

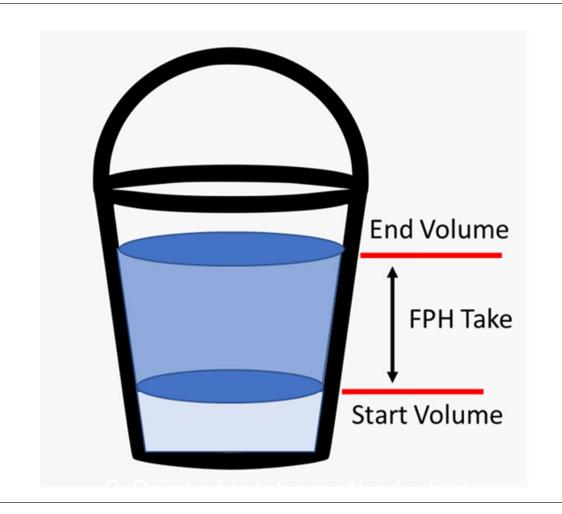

The measurement period *STARTS* when overland flow:

- Starts filling a storage, or
- Mixes with water on the property.

The measurement period *STOPS* when water is no longer flowing into a storage and all other buffer zones are empty.

Landholder nominate the beginning and end of a measurement period in iWAS.

## 6. Steps required to measure

- 1. Survey benchmark and storage curve
- 2. Primary metering equipment storage meter and local intelligence device (LID)
- 3. Secondary metering equipment (optional)
- Gauge board, or
- Another approved system such as a storage meter
